

DataPower Backup and Copy Externally Script

```
# This sample exec script:
# - produces an export zip file (fs.zip) of domain FLYServices
# - copies the file to a Linux box to a user 'localuser' filing system
# This script needs to be placed in a domain 'Admin-Utils' in the folder:
#     local:///scripts/import-export-utils
# with the name:
#     backup-scp.cfg
# and is run as follows after switching to that domain from the DataPower
# command line (CLI):
#         co
#         switch domain Admin-Utils
#         exec local:///scripts/import-export-utils/backup-scp.cfg
# Author:   Steve Edwards, IBM DataPower Specialist
# Date:     2018-12-10

# Save configuration of domain we want to backup:
switch domain FLYServices
write mem

# Command 'backup' can only be run from the 'default' domain
switch domain default
backup fs FLYServices

# Copy the file fs.zip to Linux user's filing system using scp
copy export:fs.zip scp://localuser:passw0rd@192.168.0.1

# Return the command line to the original domain, if needed
switch domain Admin-Utils
```
